IDF Curves and Climate Change

IDF curves based on historical information alone are inappropriate for long-term decision-making. To account for climate change impacts to extreme rainfall, Environment and Climate Change Canada recommends using a scaling methodology to adjust IDF curves. Read this article for additional information about integrating climate change into IDF curves, including a practical example.

Primer on Climate Change and Extreme Precipitation

Learn about current research regarding extreme precipitation in a changing climate, and why Environment and Climate Change Canada recommends temperature scaling to estimate future extreme precipitation intensities.
